DO NOT ATTEMPT TO FOLD OR UNFOLD THE WHEEL WITH THE AXLE FULLY INSERTED THROUGH THE HUB.

The hub of the wheel is designed so that axle can be pulled most of the way out of the wheel, but does not need to be pulled fully out of the wheel. There is an automatic stop built into the hub of the wheel. When folding or unfolding the wheel, without pressing the quick release button, pull the axle until it reaches the automatic stop.
**Unfolding the Wheel**

1. Pull the axle out of the hub until it reaches the automatic stop.

2. Place hands on the hand rim at 10:00 and 2:00 and pull the sides of the wheel until it is fully opened. Do not attempt to open the wheel by pushing down on the pointed ends.
   
   To ensure the wheel is completely round tap the top of the wheel with your hand or tap the wheel on the ground.

Caution:
*Never open the wheel by pulling on the tire*

3. Rotate the metal spoke towards the blue locking pin.
To lock the metal spoke in place, gently pull the spoke up towards the hand rim and slide it over the smaller section of the locking pin. If the spoke does not lock in place make sure the wheel is fully opened by tapping the top of the wheel with your hand or tapping the wheel on the ground.

5. The axle can now be fully inserted through the hub and the wheel can be connected to the wheelchair. If the axle does not go through the hub make sure the metal spoke has been locked in place.

Folding the Wheel

1. Place the wheel so the hand rim is facing away from you.
   Pull the axle out of the hub until it reaches the automatic stop.

2. To disengage the metal spoke rotate the blue lever of the locking pin counter clockwise while simultaneously gently pulling the metal spoke up towards the hand rim.
3. When folding the wheel use the blue locking tab as a guide as to where to place one of your hands. The other hand should be placed directly opposite. Push the sides of the wheel together.

4. The wheel can also be folded with one hand. Hold onto the wheel where the blue locking tab is, rest the opposite side of the wheel on the ground and push down.

5. Insert the axle through the hub to lock the wheel in the folded position. If the axle does not go through the hub make sure the metal spoke is fully rotated to its stopping point.

**Caution:** The distance between the hand rim and the wheel may be larger than you are accustomed to. Be careful not to catch your fingers between the wheel and hand rim.
